

Kuali Coeus Version 5.1.1 Release Notes

Date: July 10, 2013

Copyright © 2013 Kuali Foundation, Inc.

Purpose: The purpose of this document is to summarize the major changes included in this latest software application system release version.

For More Information: help@kuali.org

What's New in This Release?

KC Release 5.1.1 includes:

- Fixes and additional features in the Conflict of Interest (COI) to meet functional equivalence to Coeus
- Critical fixes to other KC modules
- Upgrade of Rice to version 2.1.7

Notes:

- COI workflow: If an implementer applies Kuali Enterprise Workflow (KEW) to COI disclosures, please be aware that a Disapprove action in KEW will cause the disclosure document to be locked down and uneditable.
- The KC User Manual for Release 5.1.1 will be made available in about three weeks.
- Information on KC Email Service set up can be found at: https://wiki.kuali.org/display/KRADOC/KC+Email+Service+Setup
- The KC release packaging has been modified in a way that will change deployment procedures for implementers who use the precompiled war. There is no longer a hardcoded environment within the war and it should be passed via the web application container (for example, in the catalina.sh within the JAVA_OPTS parameter as –Denvironment=ptd). If you compile the project on your own, you still have the option of hardcoding the environment within the war.

KCINFR-800	all kc services exposed for kfs integration broken
KCINFR-714	Issue with parameter kuali.docHandler.url.prefix

Important Technical Notes:

- iText 2.1.7 library is slated for removal in KC 5.2. Any implementer customizations or dependencies on this library should be removed.
- Workaround to import XML to Adobe Package (<u>KRACOEUS-6038</u>): The current implementation of saving the Grants.Gov XML requires the selection of forms to be printed before executing the Save XML action. The resulting zip document contains the XML and any related attachments needed for the selected forms. However, the XML content needs to be manipulated before it can be imported into the related Adobe Package. Implementers should use the workaround document attached to <u>KRACOEUS-6038</u> to build an XML document that can be imported into the Adobe Package.

Known Issues with Upgrade Scripts:

- While upgrading MySQL, if the Rice server has already been upgraded separately to 2.1.7, the KC mysql install results in a few errors. Since this is not a common platform or procedure to upgrade KC, we will work with individual institutions that may see these.
- While upgrading Rice from 1.0.3.x to 2.x, an error is thrown by quartz on startup which reads something like "stream classdesc serialVersionUID = 5807770268543892618. local class serialVersionUID =

5096393175403095624". The fix for this is to delete all entries from the tables krsb_qrtz_blob_triggers and krsb_qrtz_triggers and restart Tomcat or to extract the data from the quartz tables using the version of quartz installed in your current installation and import it back in using the version of quartz in the upgraded installation.

- While upgrading from versions older than Rice 2.1.7, null constraint violations
 might be thrown about existing pessimistic lock entries in the
 KRNS_PESSIMISTIC_LOCKS tables. Please delete all entries from this table
 before upgrading.
- In MySQL versions < 5.5.5, the following errors are thrown while doing a clean install of KC. This is because the default storage engine prior to 5.5.5 was MyISAM rather than InnoDB. To remedy these errors, change the default engine, recreate the schema(s) and retry. If you are upgrading a MySQL database with a version < 5.5.5 then you may need to manually convert conflicting tables that were previously created as MyISAM. Sequence tables are the only ones that you definitely do NOT want to change to InnoDB (and even that won't really cause much of an issue).</p>
